

Drinking System Stages

RED-D

Capable of eliminating submicron pathogens and inorganic contaminants by the process of electro adhesion and ion exchange.

MEMBRANE

The Alkalite membrane is NSF certified and has a high flow rate as well as an excellent track record for durability and reliability.

CARBON

Alkalite's catalytic carbon eliminates chloramine. It removes far more other problematic toxins such as pesticides, lead, fluoride, hydrogen sulphide, pharmaceuticals and more.

ALKALINE

After a decade long search for the perfect alkalizing material, O-dobi beads were created to slowly release minerals into water over time. As the timed-release O-dobi beads slowly dissolve, the healthy minerals encased in the ceramic beads mix with the filtered water to increase hydrogen and produce a higher pH (9.5+ PH LEVEL)

Reverse osmosis (RO) is a water purification process originally developed to remove the tiniest microscopic contaminants from water by pushing H2O through a semi-permeable membrane which removes up to 99.9% of impurities, toxic chemicals and viruses.
